Introduction

Goals & Motivations

Our goal is to provide users with a secure method of remote 3D printing

Goals & Motivations Approach

- 1. Develop a website which allows users to register and submit gcode files to be remotely printed by an Ender 3. Requests will be handled as a queue and processed by selected administrators. Only approved accounts will be allowed to submit requests. Various security checks will be done on submitted files to ensure their authenticity.
- 2. Communication between the website, octoprint, and the printer is facilitated over a raspberry pi. Octoprint has a pre-existing api that will allow the website to communicate with the printer in real time and display relevant information to users. Some relevant information may include time until completion and potential errors. All applications will be deployed using docker.
- 3. Ensuring each print job is completed as expected we must prevent tampering during the execution. One way in which we will attempt to prevent tampering will be to install the GreatFET in order to listen to commands currently being executed by the printer and cross reference this with the expected commands in the given gcode file.

Technical Challenges

Technical Challenges 1

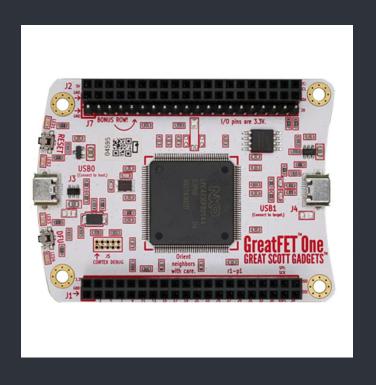

```
Octoprint's api is fairly extensive
and to utilize it to its full
potential will require a lot of
research as well as trial and
error.
```

Technical Challenges

Technical Challenges 2

```
Using the GreatFET is new
to the team so there will
be a lot of trial and error
as well as research into
how the tool works. We want
to ensure that we know how
to use it otherwise
something could break.
```

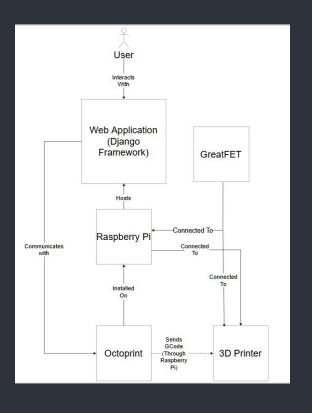

```
3D printers can fail at any point
   during the printing process, we
   need to figure out how to handle a
   failed print and have the queue
  not skip over a "completed" print.
   We also need to note that the
   printer has failed, but octoprint
does not have a check for that so
11 we need to implement how to
  determine if it has failed.
```

Progress Summary

2	
3	
4	
5	
6	
8	
9	
10	

Module feature	Completion	To Do
GUI	50%	Allowing drop down menus, mouse-over help messages
Docker Container	50%	Upload to the new raspberry pi
Networking on Raspberry pie	25%	Setup website communication with octoprint's api
Pen Testing Tools (GreatFET)	25%	Install the new software onto the raspberry pi and begin testing

Evaluation

```
Measuring success:
    Speed
         How fast does the printer move through the queue?
         How long does it take to infiltrate the system?
    Accuracy (e.g. how accurate is the system?)
         Does the 3D printer misprint?
         Does the 3D printer waste filament?
     Reliability
         How often does the 3D printer fail a print from the queue?
     User survey
         Rating of how easy the website is to navigate.
```

Milestone 4

Tasks 1-2

	Task 1: Im	plement, test & demo use of the raspberry pie to print
2	>	The web application needs to be on the raspberry pi as well as octoprint
3	>	The admin should be able to tell the printer to select the first option from t queue and begin printing
5	Task 2: Im	plement, test & demo the website interfacing with octoprint's api
6 7	>	The interface, while printing the web app should work with octoprint to displa a completion time for the user
8	>	Display print failures at any point and notify the user
9	Task 3: Ut	ilize the GreatFET to intercept and inject traffic
10 11	>	Place GreatFET in between the printer and the Raspberry and set it to listen t & forward traffic between the endpoints
12 13	>	Design functionality for the GreatFET to select and modify packet fields being transmitted as a man-in-the-middle attack.
14	>	Connect GreatFET as an endpoint to the Ender 3 printer and configure it to operate as a fuzzer.

Milestone 4

Tasks 3-4

2		
3	Task 4: I	nvestigate potential vectors for attack in the Ender 3 firmware
4 5 6	>	Given that the Ender 3 is open source, it will make it easier to look through the firmware for vulnerabilities. These vulnerabilities would given insight to see the best possible path to exploit the printer
7	>	Analyze the fuzzing traffic from Task 3 to determine any attack vectors
8	>	Utilize automated analysis tools such as centrifuge
9	Task 5: U	odate the Dockerfile to include Octoprint & Web application
10 11	>	Including all three software applications into the dockerfile will allow the team to easily pull changes together and stay up to date
12	>	This is the most efficient way to keep all of our tools together which will allow us to monitor what is installed on the raspberry pi

Milestones

Milestone 5

```
Tasks:
    Implement, test, and demo which features/modules
    Evaluation results
*
    Create poster for Senior Design Showcase
 *
```

Milestones

Milestone 6

```
Tasks:
    Implement, test, and demo which features/modules
 *
    Test/demo of the entire system
    Evaluation results
 *
    Create user/developer manual
    Create demo video
```

Milestones

Task Matrix

Task	Tiffanie	Carl	Isaiah	Nick
1. Implement, test & demo use of the raspberry pie to print	100%	0%	0%	0%
2. Implement, test & demo the website interfacing with octoprint's api	0%	100%	0%	0%
3. Utilize the GreatFET to intercept and inject traffic	0%	50%	0%	50%
4. Investigate potential vectors for attack in the Ender 3 firmware	0%	0%	100%	0%
5. Update the Dockerfile to include Octoprint & Web application	0%	0%	0%	100%
